§ 154.665

- (ii) The nominal pipe diameter is greater than 100 mm (nominal 4 in.).
- (3) If Table 4 references this section, butt welds for deck cargo piping exceeding 75 mm (3 in.) in diameter must be 100% radiographically tested.
- (4) Butt welds of pipes not meeting paragraph (b)(2) or (b)(3) of this section must meet the non-destructive testing requirements under Subpart 56.95 of this chapter.

§ 154.665 Welding procedures.

Welding procedure tests for cargo tanks for a design temperature colder than 0 $^{\circ}$ C (32 $^{\circ}$ F), process pressure vessels, and piping must meet §54.05–15 and Subpart 57.03 of this chapter.

CARGO PRESSURE AND TEMPERATURE
CONTROL

§ 154.701 Cargo pressure and temperature control: General.

Except as allowed under §154.703, cargo tanks must:

- (a) Have their safety relief valves set at a pressure equal to or greater than the vapor pressure of the cargo at 45 °C (113 °F) but not greater than the MARVS under §154.405; or
- (b) Be refrigerated by a system meeting §154.702, and each refrigerated incompatible cargo refrigerated by a separate system.

§154.702 Refrigerated carriage.

- (a) Each refrigeration system must:
- (1) Have enough capacity to maintain the cargo vapor pressure in each cargo tank served by the system below the set pressure of the relief valves under ambient temperatures of 45 °C (113 °F) still air and 32 °C (89.6 °F) still water with the largest unit in the system inoperative; or
- (2) Have a standby unit with a capacity at least equal to the capacity of the largest refrigeration unit in the system.
- (b) For the purpose of this section, a "refrigeration unit" includes a compressor and its motors and controls.
 - (c) Each refrigeration system must:
- (1) Have a heat exchanger with an excess capacity of 25 percent of the required capacity; or
 - (2) A standby heat exchanger.

- (d) Where cooling water is used in a refrigeration system:
- (1) The cooling water pump or pumps must be used exclusively for the system:
- (2) Each pump must have suction lines from sea chests on the port and starboard sides of the vessel; and
- (3) There must be a standby pump, that may be used for:
- (i) Non-essential purposes on the vessel; or
- (ii) Essential purposes on the vessel, if the pump is sized to simultaneously provide for the capacity requirements for the essential purposes and the refrigeration cooling water.
- (e) Each refrigeration system must use refrigerants that are compatible with the cargo and, for cascade units, with each other.
- (f) The pressure of the heat transfer fluid in each cooling coil in a tank must be greater than the pressure of the cargo.

§ 154.703 Methane (LNG).

Unless a cargo tank carrying methane (LNG) can withstand the pressure build up due to boil-off for 21 days, the pressure in the cargo tank must be maintained below the set pressure of the safety relief valve for at least 21 days by:

- (a) A refrigeration system that meets § 154.702:
- (b) A waste heat or catalytic furnace that burns boil-off gas, and:
- (1) Maintains the stack exhaust temperature below 535 °C (995 °F);
- (2) Exhibits no visible flame; and
- (3) Is specially approved by the Commandant (G-MSO):
- (c) Boilers, inert gas generators, and combustion engines in the main propelling machinery space that use boil-off gas as fuel; or
- (d) Equipment for services, other than those under paragraph (c) of this section, that use boil-off gas as fuel and that are located:
- (1) In the main propelling machinery space: or
- (2) a space specially approved by the Commandant (G-MSO).
